1 Deviations from our design

- We removed some of the less important information (e.g. pollen counts) on the `Today` and `Week` pages because we felt that the space was too cluttered, making it harder to read.

- We show the next 5 days instead of the next 7 on the `Week` screen to reduce clutter and improve readability.

- We made pretty much everything bigger- the title at the top of the page, the settings cog, the buttons, and most of the text. This was targeted at, again, improving readability, but also at making the buttons easier to press- we were worried that someone with poor fine motor controls would struggle with the settings cog.

- We removed a couple of unimportant little buttons on the `location` page.

- We scrapped the red-green colourblindness mode because we realised that our app didn't have any red or green, so no special adjustments were needed for that.

- We removed favourites from the location page because it was making things too cluttered and we expect that it would include almost all the same items as the recent pane.

- Enter does not automatically switch back to either the today or week screen, following the advice of our expert saying that actions should not happen automatically.
